

REMARKS / ARGUMENTS:

Claims 1, 12 and 36 have been amended by describing the distribution of the triazole fungicide in the polymer matrix as being at a molecular level or as pockets containing a plurality of triazole molecules. Support for this feature is found in the specification at least at page 17, lines 14 – 17.

Claims 1, 3 – 8, 12 – 18, 36 – 38 and 40 - 51 are in the case.

No new matter has been added.

Rejection of claims 1, 3 – 8, 12 – 18, 36 – 38 and 40 – 51 under 35 USC §112, second paragraph, as being indefinite.

The Office has argued that the language “molecular level or finely divided pockets” is unclear. Specifically, the Office maintains that it is unclear whether molecules of triazole are claimed, and how they differ from triazole dispersed in finely divided pockets. Also, the Office questions the clarity of the term “finely divided pockets”.

Claims 1, 12 and 36 --the independent claims in which the questioned terms appear – have been amended to describe the distribution of the triazole fungicide in the particle as being “dispersed in a polymer matrix at a molecular level or as pockets containing a plurality of triazole molecules”. It is important, also, that the particles being described are “solid and generally spherical”.

35 USC §112, second paragraph, requires that the claims must particularly point out and distinctly claim the metes and bounds of the subject matter that will be protected by the patent grant. When patentable subject matter is disclosed, claims should be allowed which define the patentable subject matter with a reasonable degree of particularity and distinctness. Some latitude in the manner of expression and the aptness of terms should be permitted. See, §2173.02 MPEP.

It is important that the basic structure of the present invention is understood, and it is maintained that the language of the claims, as amended, makes this clear. The present microparticles are solid, roughly spherical, particles that contain a triazole fungicide. The particles themselves are composed of a matrix polymer and are from about 0.1 to about 200 microns in size – this is much larger than the molecules of the triazole fungicide, which are distributed throughout the polymer matrix of the particle.

The claims, however, go farther in describing the location of the triazole in the particles – it is dispersed at a molecular level or as pockets containing a plurality of triazole molecules. This structure is explicitly described in the original specification. As will be discussed below, this structure is clearly distinguishable from a porous, spongy structure that contains active molecules within the pores.

In the present discussion, each term that is used is used according to its normal, conventional meaning. For example, “dispersed at a molecular level” is a well-known phrase in the art, as has been discussed in detail in the Response filed August 12, 2004.

The terms “pockets containing a plurality of triazole molecules”, are also used according to convention meanings. A dictionary definition of “pockets”, as “a small isolated area or group distinguished (as in substance, form, contents, or condition) from a larger area of group surrounding it”, is completely suitable for the present structure. *See, Webster’s Third New International Dictionary*, Merriam-Webster, Springfield, MA, a pertinent part of which is attached hereto.

Accordingly, it is maintained that the claims as presently presented particularly point out and distinctly claim the subject matter which the applicant regards as his invention, within the meaning of 35 USC §112, second paragraph, and it is respectfully requested that the present ground of rejection be reconsidered and withdrawn.

Rejection of claims 1,3,4,7 and 8 under 35 USC §103(a) as obvious over U.S. Patent No. 5,156,843 to Leong *et al.* in view of EP 0364406 to Reuter.

The Office has maintained the rejection of the stated claims under the argument that Leong *et al.* teaches controlled release particles inclusive of fungicides, which are spherical, have a particle size of from 10 – 100 microns, and which comprise the same type of polymers that can be used in the present invention, and that EP 0364406 to Reuter teaches the triazole fungicides that are features of the present claims.

Claims 1, 12 and 36 were previously amended to describe the present particles as being solid and generally spherical and have now been amended to describe the distribution of the triazole fungicide within the particles as being dispersed in a polymer matrix at a molecular level or as pockets containing a plurality of triazole molecules,

As we have pointed out previously, it is believed that this structure clearly distinguishes the present particles over the particles of Leong *et al.* Briefly, this is because Leong *et al.* describe particles in which "... the functional substance is retained in the pores of microscopic porous particles, the particles being of an inert solid material and the pores being interconnected and open to the particle surface." (col. 1, lines 51 – 55). In the particles of Leong *et al.*, the small interconnecting pore network is a central feature of the invention and prevents the particles of Leong *et al.* from being "solid particles", as are the particles of the presently claimed invention.

It is maintained, therefore, that the particles of Leong *et al.* are distinguished over those of the present invention for the reasons discussed above, and that Reuter does not provide the missing element that would guide one of ordinary skill to produce a particle having the features as now described in the amended claims. It is respectfully requested that the present rejection be reconsidered and withdrawn.

Withdrawal of rejection dependent upon Dao *et al.*

The withdrawal of this ground of rejection is acknowledged with appreciation.

Request for reconsideration:

It is respectfully requested that the claims be amended as requested above and that the claims be passed to allowance. The Examiner is invited to call the undersigned attorney at the number given below for resolution of any remaining issues.

It is believed that no fee is required for the present response. However, if a fee is required, the Office is authorized to charge the fee to Deposit Account Number 50-2548.

March 23, 2005
Date

Respectfully requested,
NELSON MULLINS RILEY & SCARBOROUGH
